

PRODUCT BRIEF

4250 MICROSCOPE ADAPTER

Hinalea Imaging offers an adapter that allows the Model 4250 hyperspectral camera to be used in microscopy. The adapter presents high quality and finely resolved images in a circular field as shown below. A 2-inch (50.8 mm) extension tube can be added to render a full-frame view if desired. The extension tube is also helpful for adapting to microscope designs that require more clearance near or at the camera mounting port.
